

You are given a string `s` and an integer array `indices` of the **same length**. The string `s` will be shuffled such that the character at the i^{th} position moves to `indices[i]` in the shuffled string.

Return *the shuffled string*.

Example 1:

Input: `s = "codeleet", indices = [4,5,6,7,0,2,1,3]`

Output: `"leetcode"`

Explanation: As shown, "codeleet" becomes "leetcode" after shuffling.

Example 2:

Input: `s = "abc", indices = [0,1,2]`

Output: `"abc"`

Explanation: After shuffling, each character remains in its position.

Constraints:

- `s.length == indices.length == n`
- `1 <= n <= 100`
- `s` consists of only lowercase English letters.
- `0 <= indices[i] < n`
- All values of `indices` are **unique**.
