

Given an array of strings `words`, return *the first **palindromic** string in the array*. If there is no such string, return an **empty string** `""`.

A string is **palindromic** if it reads the same forward and backward.

Example 1:

Input: `words = ["abc","car","ada","racecar","cool"]`
Output: `"ada"`
Explanation: The first string that is palindromic is "ada".
Note that "racecar" is also palindromic, but it is not the first.

Example 2:

Input: `words = ["notapalindrome","racecar"]`
Output: `"racecar"`
Explanation: The first and only string that is palindromic is "racecar".

Example 3:

Input: `words = ["def","ghi"]`
Output: `""`
Explanation: There are no palindromic strings, so the empty string is returned.

Constraints:

- `1 <= words.length <= 100`
- `1 <= words[i].length <= 100`
- `words[i]` consists only of lowercase English letters.
